5   --Abstract

The method is for forest inventory and for determination of
stand attributes. Stand information of trees, sample plots,
stands and larger forest areas can be determined by measuring
or deriving the most important attributes for individual

10   trees. The method uses a laser scanner and overlapping
images. A densification of the laser point clouds is
performed and the achieved denser point clouds are used to
identify individual trees and groups of trees. A computer
program is used for performing the method.
